🚀 PROMPT: Build a Professional 3D Portfolio Website

> **Paste this entire prompt into Claude Code.**
> Make sure the folder "Folder Web Biodata Saya" is in your working directory, or adjust the path below.

Role and expertise

You are a **Senior 3D Web Developer, UI/UX Designer, and Motion Specialist** with deep expertise in Three.js, WebGL, GSAP animation, scroll-driven storytelling, and immersive web experiences. You have shipped award-winning portfolio sites featured on Awwwards, CSS Design Awards, and FWA. You think in cinematic compositions, not flat layouts.

Mission

Build a **world-class personal portfolio and biodata website** for **I G.N.K. Sukma Kertha Dinata** — a Hospitality Management student and Web Enthusiast from Bali, Indonesia. The site must feel like opening a luxury hotel brochure that floats in a tropical 3D environment: elegant, immersive, and unforgettable.

Source data

All content lives in the folder `Folder Web Biodata Saya` in my working directory. Before writing any code:

1. **Read** `README.md` at the root of that folder — it maps every subfolder and file and explains all decisions already made (name format, experience split, website structure, privacy rules).
2. **Read the PDF summary** in `07-rangkuman/` — it contains the complete bio, education, work experience, organizations, achievements, certificates, skills, and a content map.
3. **Scan all images** in `01-foto/` through `04-tangkapan-layar/` — these are the visual assets.
4. **Check** `06-website-siap-pakai/` — this is a working flat HTML version. Use its content and structure as the baseline, but rebuild the frontend from scratch with 3D.

5. **Check for 3D model files** (`.glb` , `.gltf` , `.obj` , `.fbx`) and **video files** (`.mp4` , `.webm`) anywhere in the folder — use them as hero scene assets or section transitions.

Design direction

Visual identity

Element	Direction
Mood	Bali luxury meets digital craft — think tropical twilight, warm gold light filtering through leaves, water reflections
Palette	Deep forest green `#0f2f26` , warm gold `#c9962b` , cream `#f8e9cf` , soft sage `#a9d3b6` , dark slate `#1a1a2e` for contrast
Typography	Use a premium Google Font pairing. Headings: **Playfair Display** (serif, dramatic, luxury feel). Body: **Inter** or **DM Sans** (clean, modern). Accent/labels: **Space Mono** or **JetBrains Mono** (tech credibility). Load from Google Fonts CDN.
Glass & depth	Glassmorphism cards (`backdrop-filter: blur(20px)` , semi-transparent backgrounds, subtle white borders, soft shadows). Every card should feel like it floats 20px above the scene.
Micro-interactions	Hover states that feel alive: cards tilt slightly on mouse move (parallax tilt), buttons pulse softly, scroll indicators breathe.

3D scene

Requirement	Implementation
Hero environment	A Three.js scene behind the hero section: a slowly rotating tropical leaf arrangement, soft particle system (floating pollen or light specks), ambient fog. If a `.glb` model is found in the folder, load it as the centerpiece. Otherwise, generate a procedural scene with leaf-shaped geometries.
Scroll-driven animation	As the user scrolls, the 3D camera moves through the scene (dolly/orbit), and sections fade in with parallax depth. Use GSAP ScrollTrigger for timeline synchronization.
Performance	Lazy-load the 3D scene. Show a styled loading screen first. Use `requestAnimationFrame` efficiently. Add a fallback for devices without

	WebGL: the SVG forest background from the flat version.
Section transitions	Between major sections, play a subtle 3D transition (camera pan, depth-of-field shift, or particle burst). If `.mp4` / `.webm` video files are in the folder, use them as looping background textures on 3D planes or as section dividers.

Layout (mobile-first, then desktop)

```
┌──────────────────────────────────────────┐
│  HERO                                    │

```

Typography styling

Make the text feel crafted, not generic:

- **Hero name:** large, bold, with a subtle text-shadow glow matching the gold accent. On desktop, consider a split-text reveal animation (letters slide in from below, staggered).
- **Section headings:** Playfair Display, generous letter-spacing, a thin gold underline that draws itself on scroll-enter.
- **Body text:** Inter/DM Sans, comfortable line-height (1.65), slightly warm white (`#f4faf5`) for readability on dark backgrounds.
- **Labels and dates:** monospace accent font, smaller, muted gold or sage color, uppercase.
- **Skill chips:** rounded pill shape, subtle glass background, hover glow.
- **Timeline dots:** radial gradient gold circles with a soft halo, connected by a thin gradient line.

Technical requirements

Stack

Layer	Technology
Structure	Single `index.html` file (self-contained)

3D	Three.js (load from CDN: `https://cdnjs.cloudflare.com/ajax/libs/three.js/r128/three.min.js`)
Animation	GSAP + ScrollTrigger (load from CDN)
Styling	Vanilla CSS with CSS custom properties (no Tailwind, no build step)
Fonts	Google Fonts (Playfair Display + Inter or DM Sans)
Server	The existing `app.py` (Python simple HTTP server, no dependencies)
Images	All images from `static/` folder. Do NOT embed base64 — reference as `static/filename.jpg`

File output

```
06-website-siap-pakai/
├── app.py          (keep the existing one, or improve it)
├── index.html      (the entire 3D website — HTML, CSS, JS in one file)
└── static/         (all images, 3D models, and videos)
```

Performance rules

1. **Loading screen:** show a styled progress bar while Three.js and assets load. Theme it with the forest/gold palette.
2. **Intersection Observer:** only animate elements when they enter the viewport.
3. **`will-change`** on animated elements, remove after animation completes.
4. **Image `loading="lazy"`** on everything below the fold.
5. **WebGL fallback:** if `WebGLRenderingContext` is not available, hide the canvas and show the SVG forest background instead.
6. **Mobile:** disable heavy 3D on screens < 768px. Use CSS parallax and GSAP animations instead. The site must still look stunning without WebGL.

Accessibility

- All images have descriptive `alt` text.
- Sections use semantic HTML (`<section>`, `<nav>`, `<main>`, `<header>`).
- Color contrast passes WCAG AA on all text.
- Respect `prefers-reduced-motion`: disable all animations, show static layout.
- Keyboard navigation works on all interactive elements.

Content rules (from README.md)

- **Name:** always `I G.N.K. Sukma Kertha Dinata .`
- **Language:** English.
- **Experience:** split into "with proof" (tappable certificate/letter image) and "narrative only" (text, no attachment).
- **Privacy:** do NOT show height, weight, religion, or full home address. Show WhatsApp number, email, and city (Denpasar, Bali) only.
- **CV download:** include a download button linking to `static/CV_Sukma_Kertha_Dinata.pdf .`

What to deliver

1. **`index.html`** — the complete 3D portfolio website.
2. **Updated `static/` folder** — if you process any new images or assets, place them here.
3. **`app.py`** — keep or improve the existing local server.
4. A brief summary of what you built and how to run it.

Quality bar

This site will be shown to international hospitality recruiters and J-1 program coordinators. It must communicate:

- **Professionalism** — this person works in 5-star hotels.
- **Technical skill** — this person builds immersive web experiences.
- **Leadership** — this person leads organizations and committees.
- **Ambition** — this person is going places.

The site should make someone say: *"This student built THIS?"*

Start by reading `README.md` and the PDF summary, then build.
